Wormholes in spacetime and their use for interstellar travel: A tool for teaching general relativity

Michael S. Morris and Kip S. Thorne

Theoretical Astrophysics, California Institute of Technology, Pasadena, California 91125

(Received 16 March 1987; accepted for publication 17 July 1987)

Rapid interstellar travel by means of spacetime wormholes is described in a way that is useful for teaching elementary general relativity. The description touches base with Carl Sagan’s novel Contact, which, unlike most science fiction novels, treats such travel in a manner that accords with the best 1986 knowledge of the laws of physics. Many objections are given against the use of black holes or Schwarzschild wormholes for rapid interstellar travel. A new class of solutions of the Einstein field equations is presented, which describe wormholes that, in principle, could be traversed by human beings. It is essential in these solutions that the wormhole possess a throat at which there is no horizon; and this property, together with the Einstein field equations, places an extreme constraint on the material that generates the wormhole’s spacetime curvature: In the wormhole’s throat that material must possess a radial tension \( \tau_0 \) with the enormous magnitude

\[
\tau_0 \sim (\text{pressure at the center of the most massive of neutron stars}) \times (20 \text{ km})^2 / (\text{circumference of throat})^2.
\]

Moreover, this tension must exceed the material’s density of mass-energy, \( \rho_0 c^2 \). No known material has this \( \tau_0 > \rho_0 c^2 \) property, and such material would violate all the “energy conditions” that underlie some deeply cherished theorems in general relativity. However, it is not possible today to rule out firmly the existence of such material; and quantum field theory gives tantalizing hints that such material might, in fact, be possible.
Box 1. Excerpts from *Contact* by Carl Sagan.19

After traveling through some sort of “tunnel” that took them in less than an hour from Earth to an orbit around the star Vega, five of the characters in the novel speculate on the nature of the tunnel:

“You see,” Eda explained softly, “if the tunnels are black holes there are real contradictions implied. There is an interior tunnel in the exact Kerr solution of the Einstein Field Equations, but it’s unstable. The slightest perturbation would seal it off and convert the tunnel into a physical singularity through which nothing can pass. I have tried to imagine a superior civilization that would control the internal structure of a collapsing star to keep the interior tunnel stable. This is very difficult. The civilization would have to monitor and stabilize the tunnel forever. It would be especially difficult with something as large as the dodecahedron falling through.”

“Even if Abonnema can discover how to keep the tunnel open, there are many other problems,” Vaygay said. “Too many. Black holes collect problems faster than they collect matter. There are the tidal forces. We should have been torn apart in the black hole’s gravitational field. We should have been stretched like people in the paintings of El Greco or the sculptures of... Giacometti. Then other problems: As measured from Earth it takes an infinite amount of time for us to pass through a black hole, and we could never, never return to Earth. Maybe this is what happened. Maybe we will never go home.

Then, there should be an inferno of radiation near the singularity. This is a quantum mechanical instability...”

“And finally,” Eda continued, “a Kerr-type tunnel can lead to grotesque causality violations. With a modest change of trajectory inside the tunnel, one could emerge from the other end as early in the history of the universe as you might like—a picosecond after the big bang, for example. That would be a very disorderly universe.

“Look, fellas,” she said, “I’m no expert in General Relativity. But didn’t we see black holes? Didn’t we fall into them? Didn’t we emerge out of them? Isn’t a gram of observation worth a ton of theory?”

“I know, I know,” Vaygay said in mild agony. “It has to be something else. Our understanding of physics can’t be so far off. Can it?”

He addressed this last question, a little plaintively, to Eda, who only replied, “A naturally occurring black hole can’t be a tunnel; they have impassible singularities at their centers.”

Pages 347, 348

Eda was, considering the circumstances, very relaxed. She soon understood why. While she and Vaygay had been undergoing lengthy interrogations, he had been calculating.

“I think the tunnels are Einstein–Rosen bridges,” he said. “General relativity admits a class of solutions, called wormholes, similar to black holes, but with no evolutionary connection—they cannot be generated, as black holes can, by the gravitational collapse of a star. But the usual sort of wormhole, once made, expands and contracts before anything can cross through; it exerts disastrous tidal forces, and it also requires—at least as seen by an observer left behind—an infinite amount of time to get through.”

Ellie did not see how this represented much progress, and asked him to clarify. The key problem was holding the wormhole open. Eda had found a class of solutions to his field equations that suggested a new macroscopic field, a kind of tension that could be used to prevent a wormhole from contracting fully. Such a wormhole would pose none of the other problems of black holes; it would have much smaller tidal stresses, two-way access, quick transit times as measured by an exterior observer, and no devastating interior radiation field.

“I don’t know whether the tunnel is stable against small perturbations,” he said. “If not, they would have to build a very elaborate feedback system to monitor and correct the instabilities.”

Page 406
Morris-Thorne’s “Traversable” wormhole

Desired properties of traversable WHs

1. Spherically symmetric and Static ⇒ M. Visser, PRD 39(89) 3182 & NPB 328 (89) 203
2. Einstein gravity
3. Asymptotically flat
4. No horizon for travel through
5. Tidal gravitational forces should be small for traveler
6. Traveler should cross it in a finite and reasonably small proper time
7. Must have a physically reasonable stress-energy tensor
   ⇒ Weak Energy Condition is violated at the WH throat.
   ⇒ (Null EC is also violated in general cases.)
8. Should be perturbatively stable
9. Should be possible to assemble

Why Wormhole?

They increase our understanding of gravity when the usual energy conditions are not satisfied, due to quantum effects (Casimir effect, Hawking radiation) or alternative gravity theories, brane-world models etc.

They are very similar to black holes --both contain (marginally) trapped surfaces and can be defined by trapping horizons (TH).

\[
\text{Wormhole} = \text{Hypersurface foliated by marginally trapped surfaces}
\]

BH and WH are interconvertible? New duality?
BH & WH are interconvertible?

They are very similar -- both contain (marginally) trapped surfaces and can be defined by trapping horizons (TH)

Only the causal nature of the THs differs, whether THs evolve in plus / minus density which is given locally.

ABSTRACT

A method to calculate light curves of the gravitational microlensing of the Ellis wormhole is derived in the weak-field limit. In this limit, lensing by the wormhole produces one image outside the Einstein ring and another image inside. The weak-field hypothesis is a good approximation in Galactic lensing if the throat radius is less than 10^{11} km. The light curves calculated have gutters of approximately 4% immediately outside the Einstein ring crossing times. The magnification of the Ellis wormhole lensing is generally less than that of Schwarzschild lensing. The optical depths and event rates are calculated for the Galactic bulge and Large Magellanic Cloud fields according to bound and unbound hypotheses. If the wormholes have throat radii between 100 and 10^{7} km, are bound to the galaxy, and have a number density that is approximately that of ordinary stars, detection can be achieved by reanalyzing past data. If the wormholes are unbound, detection using past data is impossible.

Key words: gravitational lensing: micro

Online-only material: color figures
Part 2  WH in higher-dim. (1) Exact Solution

(1) Exact Solution : Basic eqns.

- general relativity, \textit{n-dimension}

\[ S = \int d^n x \sqrt{-g} \left[ \frac{1}{2\kappa_n^2} R - \frac{1}{2} \epsilon (\partial \phi)^2 - V(\phi) \right], \quad \epsilon = -1 \]

- static, spherical sym., asymptotically flat

\[ ds_n^2 = -f(r)dt^2 + f(r)^{-1} dr^2 + R(r)^2 h_{ij} dx^i dx^j \]

- Basic equations

\[(t,t) : \quad -\frac{n-2}{2} f^2 \left[ \frac{2R''}{R} + \frac{f'R'}{fR} + \frac{(n-3)R'^2}{R^2} \right] + \frac{(n-2)(n-3)kf R''}{2R^2} = \kappa_n^2 f \left[ \frac{1}{2} \epsilon f \phi'^2 + V(\phi) \right], \]

\[(r,r) : \quad \frac{n-2}{2} \frac{R'}{R} \left[ \frac{f'}{f} + \frac{(n-3)R'}{R} \right] - \frac{(n-2)(n-3)k}{2f R^2} = \kappa_n^2 f \left[ \frac{1}{2} \epsilon f \phi'^2 - V(\phi) \right], \]

\[(i,j) : \quad \frac{f''}{f} + (n-3)f \left( \frac{R''}{R} + \frac{f'R'}{fR} + \frac{n-4}{2} \frac{R'^2}{R^2} \right) - \frac{(n-3)(n-4)k}{2R^2} = \kappa_n^2 \left[ \frac{1}{2} \epsilon f \phi'^2 + V(\phi) \right], \]

\[(KG) : \quad \frac{1}{R^{n-2}} (R^{n-2} f \phi')' = -\epsilon \frac{dV}{d\phi}. \quad \phi' = \frac{C}{f R^{n-2}} \]
Part 2  WH in higher-dim. (1) Exact Solution

Solution

\[ ds_n^2 = -f(r)dt^2 + f(r)^{-1}dr^2 + R(r)^2h_{ij}dx^idx^j \]

- regularity at the throat \( r = 0 \)
  \[ R = a \quad \text{throat radius} \]
  \[ R' = 0, \quad f = f_0, \quad f' = 0, \quad \phi = 0 \]

\[ a = 1 \quad f_0 = 1 \]

Basics eqns. \[ \kappa_n C^2 = (n - 2)(n - 3)a^{2(n-3)} \]

- Exact solution

\[ f \equiv 1 \]

\[ r(R) = -mB_z\left[-m, \frac{1}{2}\right] - \frac{\sqrt{\pi}\Gamma[1 - m]}{\Gamma[m(n - 4)]} \]

\[ \phi = \frac{\sqrt{(n - 2)(n - 3)}}{\kappa_n} a^{n-3} \int \frac{1}{R(r)^{n-2}} dr \]

\[ m = \frac{1}{2(n - 3)}, \quad z = R^m, \quad B_z(p, q) := \int_0^z t^{p-1}(1 - t)^{q-1} dt \quad \text{Incomplete Beta func.} \]

\[ \star \text{ in another metric form: V. Dzhunushaliev+}, 2013 \]
Part 2  WH in higher-dim. (1) Exact Solution

Configurations

- configurations

\[ ds_n^2 = -f(r) dt^2 + f(r)^{-1} dr^2 + R(r)^2 h_{ij} dx^i dx^j \]

\[ R = r + 1 \quad \phi = 0 \quad (r = 0) \quad \frac{\pi}{2} \quad (r > 0) \]

- expansion is 0
  trapping horizon

- large curvature near the throat.
- scalar field goes steep if \( n \) is large.

- In the \( n \to \infty \) limit
Part 2  WH in higher-dim. (2) Linear Stability

(2) Linear Stability: Master eqn.

▪ metric

\[ ds_n^2 = -f(t, r)e^{-2\delta(t, r)}dt^2 + f(t, r)^{-1}dr^2 + R(t, r)^2h_{ij}dx^i dx^j \]

▪ linear perturbation

\[ f = f_0(r) + f_1(r)e^{i\omega t}, \quad R = R_0(r) + R_1(r)e^{i\omega t}, \]
\[ \delta = \delta_0(r) + \delta_1(r)e^{i\omega t}, \quad \phi = \phi_0(r) + \phi_1(r)e^{i\omega t}. \]

▪ master equation

\[ -\Psi_1'' + W(r)\Psi_1 = \omega^2\Psi_1, \]
\[ W(r) = -\frac{1}{4R_0^2}\left[ \frac{3(n-2)^2}{R_0^{2(n-3)}} - (n-4)(n-6) \right]. \]

\[ \Psi_1 = D_+\psi_1 \quad D_+ = \frac{d}{dr} - \frac{\ddot{\psi}_1}{\psi_1} \quad \psi_1 = R_0^{-\frac{n-2}{2}}\left( \phi_1 - \frac{\phi'_0}{R_0}R_1 \right), \]

★ \( \Psi_1 \): Gauge invariant in spherical sym.

\]

**Klein-Gordon eqs.**

\[
\Box\phi = \frac{e^f}{r} \left(2r\phi_{,wv} + (n - 2)r_{uv}\phi_{,v} + (n - 2)r_{v}\phi_{,u}\right)
= -2e^f\phi_{,wv} - e^f\Omega^2 (\vartheta^-p^- + \vartheta^+p^+)
\]

**Energy-momentum tensor**

\[
T_{++} = \Omega^2(\pi_+^2 - p_+^2)
T_{--} = \Omega^2(\pi_-^2 - p_-^2)
T_{+-} = -e^{-f}(V_1(\psi) + V_2(\phi))
T_{zz} = e^f(\pi_+\pi_- - p_+p_-) - \frac{1}{\Omega^2}(V_1(\psi) - V_2(\phi))
\]
Let \( \tilde{\alpha} = (n-3)(n-4)\alpha_2 \), \( \tilde{\Lambda} = \frac{2\Lambda}{(n-1)(n-2)} \), and \( A = \alpha_1 + 2\tilde{\alpha}\Omega^2(k+W) \).

\[
\begin{align*}
\partial_+ \Omega & = -\frac{1}{n-2} \vartheta_+ \Omega^2 \\
\partial_+ \vartheta_+ & = -\vartheta_+ \nu_+ - \frac{1}{A} \kappa^2 \Omega (\pi_+^2 - p_+^2) \\
\partial_+ \vartheta_- & = \frac{1}{A} e^{-f} \left\{ -\frac{\alpha_1 \Omega^2 (n-2)(n-3)}{2} (k+W) + \Lambda + \kappa^2 (V_1 + V_2) \right\} - \frac{\tilde{\alpha}}{A} \Omega^3 e^{-f} \frac{(n-2)(n-5)}{2} \left\{ (k+W)^2 + W \right\} \\
\partial_+ \nu_+ & = \nu_+ \\
\partial_+ \nu_- & = \frac{\alpha_1}{A} Z e^{-f} \Omega^2 \frac{(n-3)}{2} \left\{ -\frac{\alpha_1}{A} 2(n-3) + n - 4 \right\} \\
& \quad + \frac{1}{A} \Omega^2 e^{-f} \kappa^2 (\pi_+ \pi_- - p_+ p_-) + \frac{1}{A} e^{-f} \left\{ \frac{\alpha_1}{A} \frac{2(n-3)}{(n-2)} - 1 \right\} \left\{ \Lambda + \kappa^2 (V_1 + V_2) \right\} \\
& \quad - \frac{\tilde{\alpha}}{A} e^{-f} \Omega^2 (n-5) \times \frac{\alpha_1}{A} \Omega^2 (n-3) \left\{ k^2 + 2WZ + 2Z^2 \right\} - \frac{\tilde{\alpha}}{A} e^{-f} \Omega^2 (n-5) \times \frac{\tilde{\alpha}}{A} \Omega^4 2(n-5) \left\{ k^2 + 2WZ \right\} Z \\
& \quad + \frac{\tilde{\alpha}}{A} e^{-f} \Omega^2 (n-5) \times \frac{\alpha_1}{A} 2(n-2) \left\{ (n-2)k^2 + 2WZ - 4Z^2 \right\} + \frac{\tilde{\alpha}}{A} e^{-f} \Omega^2 (n-5) \times \frac{1}{A} \frac{4}{n-2} Z \left\{ \Lambda + \kappa^2 (V_1 + V_2) \right\} \\
& \quad - \frac{\tilde{\alpha}}{A} e^{f} \Omega^2 \frac{4}{(n-2)^2} \left\{ \nu_+ \vartheta_+ (\vartheta_+ \vartheta_-) + \nu_- \vartheta_- (\vartheta_+ \vartheta_+) + (\vartheta_+ \vartheta_+) (\vartheta_+ \vartheta_-) + \nu_+ \nu_- \vartheta_+ \vartheta_- - (\vartheta_- \vartheta_+)^2 \right\} \\
\partial_+ \psi & = \Omega \pi_+ \\
\partial_+ \phi & = \Omega p_+ \\
\partial_+ \pi_+ & = \text{no equation} \\
\partial_+ \pi_- & = \left( \frac{1}{n-2} - \frac{1}{2} \right) \Omega \vartheta_+ \pi_- - \frac{1}{2} \Omega \vartheta_- \pi_+ - \frac{1}{2 e^{-f} \Omega} \frac{dV_1}{d\psi} \\
\partial_+ p_+ & = \text{no equation} \\
\partial_+ p_- & = \left( \frac{1}{n-2} - \frac{1}{2} \right) \Omega \vartheta_+ p_- - \frac{1}{2} \Omega \vartheta_- p_+ - \frac{1}{2 e^{f} \Omega} \frac{dV_2}{d\phi}
\end{align*}
\]
\( \mathbf{x}^- \)-direction

\[
\begin{align*}
\partial_- \Omega &= -\frac{1}{n-2} \partial_- \Omega^2 \\
\partial_- \vartheta_+ &= \partial_+ \vartheta_- \\
\partial_- \vartheta_- &= -\vartheta_- \nu_- - \frac{1}{A} \Omega \kappa^2 (\pi_-^2 - p_-^2) \\
\partial_- f &= \nu_- \\
\partial_- \nu_+ &= \partial_+ \nu_- \\
\partial_- \nu_- &= \text{no equation} \\
\partial_- \psi &= \Omega \pi_- \\
\partial_- \phi &= \Omega p_- \\
\partial_- \pi_+ &= -\frac{1}{2} \Omega \vartheta_+ \pi_- + \left( \frac{1}{n-2} - \frac{1}{2} \right) \Omega \vartheta_- \pi_+ - \frac{1}{2e_f \Omega} \frac{dV_1}{d\psi} \\
\partial_- \pi_- &= \text{no equation} \\
\partial_- p_+ &= -\frac{1}{2} \Omega \vartheta_+ p_- + \left( \frac{1}{n-2} - \frac{1}{2} \right) \Omega \vartheta_- p_+ - \frac{1}{2e_f \Omega} \frac{dV_2}{d\phi} \\
\partial_- p_- &= \text{no equation}
\end{align*}
\]

This constitutes the first-order dual-null form, suitable for numerical coding.
**initial data**

- **Static condition**

\[
\begin{align*}
(\partial_+ + \partial_-)\Omega &= 0 \implies \vartheta_+ + \vartheta_- = 0 \\
(\partial_+ + \partial_-)\psi &= 0 \implies \pi_+ + \pi_- = 0 \\
(\partial_+ + \partial_-)\phi &= 0 \implies p_+ + p_- = 0 \\
(\partial_+ + \partial_-)\vartheta_+ &= 0 \implies \vartheta_+\nu_+ + \frac{1}{A}\Omega\kappa^2(\pi_+^2 - p_+^2) = \vartheta_-\nu_- + \frac{1}{A}\Omega\kappa^2(\pi_-^2 - p_-^2)
\end{align*}
\]

- **Solve** \(x^+\) and \(x^-\) equations with the starting condition at the throat

\[
\begin{align*}
\vartheta_+ &= \vartheta_- (= 0) \\
\nu_+ &= \nu_- (= 0) \\
-\kappa^2\Omega(\pi_+^2 - p_+^2)e^f &= -\frac{1}{\Omega} \left[ -\alpha_1\Omega^2\frac{(n - 2)(n - 3)}{2}k + \Lambda + \kappa^2(V_1 + V_2) \right] + \tilde{\alpha}\Omega^3\frac{(n - 2)(n - 5)}{2}k^2
\end{align*}
\]

If we assume only ghost field \(\phi\), then

\[
p_+ = -p_- = \sqrt{\frac{1}{\kappa^2e^f} \left[ \alpha_1\frac{(n - 2)(n - 3)}{2}k - \frac{1}{\Omega^2}(\Lambda + \kappa^2V_2) + \tilde{\alpha}\Omega^2\frac{(n - 2)(n - 5)}{2}k^2 \right]}
\]

- **add perturbation**

\[
p_+(x^+ = x, x^- = 0) = p_+(\text{solution}) + a \exp[-100(x - 0.5)^2]
\]
ghost pulse (negative amp.) input

double trapping horizon

positive energy input --> BH formation
ghost pulse (positive amp.) input

4d 5d 6d GR

ghost pulse (c₁=0.1) input

θ+ = 0

θ− = 0

double trapping horizon

negative energy input --> throat inflates
BH mass (Misner-Sharp mass)

\[ E_n = \frac{(n-2)A_{n-2}}{2\kappa_{n-2}^2} \Omega \left[ -\frac{1}{\Omega^2} \frac{\Delta}{\text{vol}} + \left( k + \frac{2}{(n-2)^2} e^j \vartheta_+ \vartheta_- \right) \right] \]

(Maeda & Nozawa, 2008)
Part 3. Wormhole in Gauss-Bonnet gravity

**Dynamics in Gauss-Bonnet gravity?**

- **Action**

\[
S = \int_M d^{N+1}x \sqrt{-g} \left[ \frac{1}{2\kappa^2} \left\{ \alpha_1 R + \alpha_2 \mathcal{L}_{GB} \right\} + \mathcal{L}_{\text{matter}} \right]
\]

where \( \mathcal{L}_{GB} = R^2 - 4R_{\mu\nu}R^{\mu\nu} + R_{\mu\nu\rho\sigma}R^{\mu\nu\rho\sigma} \)

- **Field equation**

\[
\alpha_1 G_{\mu\nu} + \alpha_2 H_{\mu\nu} + g_{\mu\nu}\Lambda = \kappa^2 T_{\mu\nu}
\]

where \( H_{\mu\nu} = 2[\mathcal{R}\mathcal{R}_{\mu\nu} - 2\mathcal{R}_{\mu\alpha}\mathcal{R}^{\alpha}_{\nu} - 2\mathcal{R}^{\alpha\beta}\mathcal{R}_{\mu\alpha\nu\beta} + \mathcal{R}_{\mu}^{\alpha\beta\gamma}\mathcal{R}_{\nu\alpha\beta\gamma}] - \frac{1}{2}g_{\mu\nu}\mathcal{L}_{GB} \)

- has GR correction terms from String Theory
- has two solution branches (GR/non-GR).
- is expected to have singularity avoidance feature.
  (but has never been demonstrated.)

7 dim.
Part 5. In Search of Stable Wormholes: Previous approaches

Thin-shell wormhole

- Poisson & Visser, PRD52 (1995) 7318

Galilean Wormholes

Two Schwarzschild spacetimes are connected by a singular thin shell using the Israel's junction condition.

- They defined the parameter $\beta_0$, which corresponds to the sound velocity in the shell.

\[ \beta_0^2 := \frac{\partial p}{\partial \sigma} \]

- They found the parameter regions where the solution is stable.

\[ \beta_0^2 \geq \frac{3}{2} + \sqrt{3} \quad (a^-_0 < a_0 < a^+_0) \]
\[ \beta_0^2 \leq -\frac{1}{2} \quad (a_0 > a^-_0) \]

Sound speed is faster than the light speed or become imaginary.

- “There is no guarantee that $\beta_0$ actually is the speed of sound because the matter is exotic (negative energy)!"
Part 5. In Search of Stable Wormholes: Previous approaches

(peculiar) EOS

★ In 4-dim. GR. perfect fluid and source free electro-magnetic field.
★ The pressure of the fluid is zero for the static solution. However, if we perturb it, the pressure appears! → stable wormhole
★ However, the matter field must satisfy a certain EOS.

Does the matter behaves like this?

dilatonic Einstein-Gauss-Bonnet theory

- Kanti, Kleihaus and Kunz, (PRL107 (2011) 271101)

★ No exotic matter and linearly stable!
★ However, they fix the throat radius.

The stability analysis is insufficient.
Part 5. In Search of Stable Wormholes: with cosmological constant

Wormhole in GR with $\Lambda$

- general relativity, $n$-dimensions

\[ S = \int d^n x \sqrt{-g} \left[ \frac{1}{2\kappa_n^2} (R - 2\Lambda) - \frac{1}{2} \epsilon (\nabla \phi)^2 - V(\phi) \right] \quad \epsilon = -1 \quad \text{(ghost)} \]

- static spacetime

\[ ds_n^2 = -f(r)dt^2 + f(r)^{-1}dr^2 + R(r)^2 h_{ij}dx^i dx^j \]

$R$ is the area radius.

- the line element of the (n-2)-dimensional sub-manifold. It is assumed to be a constant curvature space with curvature $k$.

- $\Lambda = 0$
  - 4-dim: Ellis wormhole (1973)
  - n-dim: Torii & HS (2013)
Part 5. In Search of Stable Wormholes: with cosmological constant

**equations**

- **Einstein equations and the Klein-Gordon equation**

\[
(t, t) \quad -\frac{n-2}{2} f^2 \left[ \frac{2R''}{R} + \frac{f'R'}{fR} + \frac{(n-3)R^2}{R^2} \right] + \frac{(n-2)(n-3)kf}{2R^2} \lambda f = \frac{\kappa_n^2}{2} \epsilon f^2 \phi'^2,
\]

\[
(r, r) \quad \frac{n-2}{2} \frac{R'}{R} \left[ \frac{f'}{f} + \frac{(n-3)R'}{R} \right] - \frac{(n-2)(n-3)kf}{2fR^2} + \frac{\Lambda}{f} = \frac{\kappa_n^2}{2} \epsilon f \phi'^2,
\]

\[
(i, j) \quad \frac{f''}{2} + (n-3)f \left( \frac{R''}{R} + \frac{f'R'}{fR} + \frac{(n-4)R^2}{2R^2} \right) - \frac{(n-3)(n-4)kf}{2R^2} = \frac{\kappa_n^2}{2} \epsilon f \phi'^2.
\]

**KG**

\[
\frac{1}{R^{n-2}} (R^{n-2} f \phi')' = 0.
\]

The Klein-Gordon equation can be integrated, and the scalar field is obtained by integrating the metric functions.

\[
\phi' = \frac{C}{fR^2}, \quad (1)
\]

The Einstein equations are reduced to two equations.

\[
\frac{(n-2)R'}{R} \left[ \frac{f'}{f} + \frac{(n-3)R'}{R} \right] - \frac{(n-2)(n-3)kf}{fR^2} + \frac{2\Lambda}{f} = -\frac{\kappa_n^2 C^2}{f^2 R^2(n-2)} \quad (2)
\]

\[
\frac{(n-2)R''}{R} = \frac{\kappa_n^2 C^2}{f^2 R^2(n-2)} \quad (3)
\]
boundary conditions

- regularity condition (+ symmetry) at the throat \( r = 0 \)

  \[
  \begin{align*}
  R &= a \\
  R' &= 0 \\
  f &= f_0 \\
  f' &= 0
  \end{align*}
  \]

  We also assume the mirror symmetry at the throat. We can extend the solution to non-symmetric one.

- shift symmetry \( \phi = 0 \)

- Asymptotically AdS
Part 5. In Search of Stable Wormholes: with cosmological constant

existence of solutions

- At the throat, Einstein equation 2 becomes

\[ \kappa_n C^2 = f_0 \left[ (n-2)(n-3)k a^{2(n-3)} - 2\Lambda a^{2(n-2)} \right] \Rightarrow \Lambda < \frac{(n-2)(n-3)}{2a^2} k. \tag{4} \]

- For the positive c.c., k is positive and the cosmological horizon should appear.

\[ k = 1 \quad \text{and} \quad f = 0 \text{ at } r = r_C \]

\[ \phi' \to \infty, \quad R'' \to \infty \text{ at } r = r_C \quad \text{The spacetime becomes singular!} \]

There is no regular wormhole solution for positive cosmological constant.

- For the negative c.c.,

there is no constraint for \( k = 1, 0 \).

\[ k = -1 \quad \Rightarrow \quad a > \sqrt{\frac{(n-2)(n-3)}{2|\Lambda|}}. \]

Throat radius has the lower limit.

Part 5. In Search of Stable Wormholes: with cosmological constant

**linear stability analysis**

In the rest of this section, we examine the linear stability of the higher-dimensional Ellis wormhole.

- metric ansatz

\[ ds_n^2 = -f(t,r)e^{-2\delta_{t,r}}dt^2 + f(t,r)^{-1}dr^2 + R(t,r)^2 h_{ij}dx^i dx^j \]

We consider only the spherically symmetric perturbations.

- These functions are expanded.

The variables with 0 are the static solutions.

\[ f = f_0(r) + f_1(r)e^{i\omega t}, \quad R = R_0(r) + R_1(r)e^{i\omega t}, \]
\[ \delta = \delta_0(r) + \delta_1(r)e^{i\omega t}, \quad \phi = \phi_0(r) + \phi_1(r)e^{i\omega t}. \]
\[ \omega \] is a frequency.

The variables with 1 are the perturbations.

- By taking linear combination, we can find the single **master equation**.

\[ \psi_1 = R_0^{\frac{n-2}{2}} \left( \phi_1 - \frac{\phi'_0}{R'_0} R_1 \right), \]

\[ \text{gauge invariant under spherical symmetry} \]
By taking linear combination, we can find the single master equation.

\[ \psi_1 = R_0^{-\frac{n-2}{2}} \left( \phi_1 - \frac{\phi_0'}{R_0'} R_1 \right), \quad \text{gauge invariant under spherical symmetry} \]

\[ -\frac{d^2 \psi_1}{dr_*^2} + V(r) \psi_1 = \omega^2 \psi_2 \]

\[ V(r) = \frac{2C^2 R_0^{-2n+4}}{(n-2)f_0 R_0'^2} \left[ (n-3)k - \frac{2\Lambda R_0^2}{n-2} \right] - \Lambda f_0 + \frac{(n-2)f_0}{4R_0^2} \left[ 2(n-3)k - (n-2)f_0 R_0'^2 \right]. \]

The potential is positive definite. \( \therefore \) stable.

0-mode solution \( \bar{\psi}_1 \) The mode which changes the throat radius.

The 0-mode diverges at the throat.

This divergence is canceled by the divergence of the potential function.
regularize the perturbation equation by the 0-mode

\[
\mathcal{D}_* = \pm \frac{d}{dr} - \frac{1}{\psi_1} \frac{\psi_1}{dr_*}
\]

the perturbation equation

\[
\mathcal{D}_* \mathcal{D}_+ \psi_1 = \omega^2 \phi_1.
\]

- Operating \( \mathcal{D}_+ \) on the equation and defining \( \Psi_1 = \mathcal{D}_+ \psi_1 \), ....

- We find the regularized equation.

\[
- \frac{d^2 \Psi_1}{dr_*^2} + W(r) \Psi_1 = \omega^2 \Psi_1
\]

\[
W(r) = 2f_0^2 \left( \frac{1}{\psi_1} \frac{d\psi_1}{dr_*} \right)^2 - V(r)
\]

For \( n = 4 \) and \( \ell_{ads} = 1 \), the potential \( W \) is positive definite for \( a > 1 \). Hence these wormholes are stable!!
Solving this equation numerically, we can find a negative mode for $a < 0.4$.

![Graph of eigenvalue of negative mode](image1)

![Graph of eigenfunction of the negative mode](image2)

For $n=4$ and $l_{ads}=1$,

- $a > 0.4$ stable
- $a < 0.4$ unstable
AdS wormhole evolution

Ellis WH with negative $\Lambda$, $n=4$
