## Outline & Summary

The ringdown part of gravitational waves in the final stage of merger of compact objects tells us the nature of strong gravity which can be used for testing the theories of gravity. The ringdown waveform, however, fades out in a very short time with a few cycles, and hence it is challenging for gravitational wave data analysis to extract the ringdown frequency and its damping time scale. We here propose to build up a suite of mock data of gravitational waves to compare the performance of various approaches developed to detect quasi-normal modes from a black hole. In this paper we present our initial results of comparisons of the following five methods;

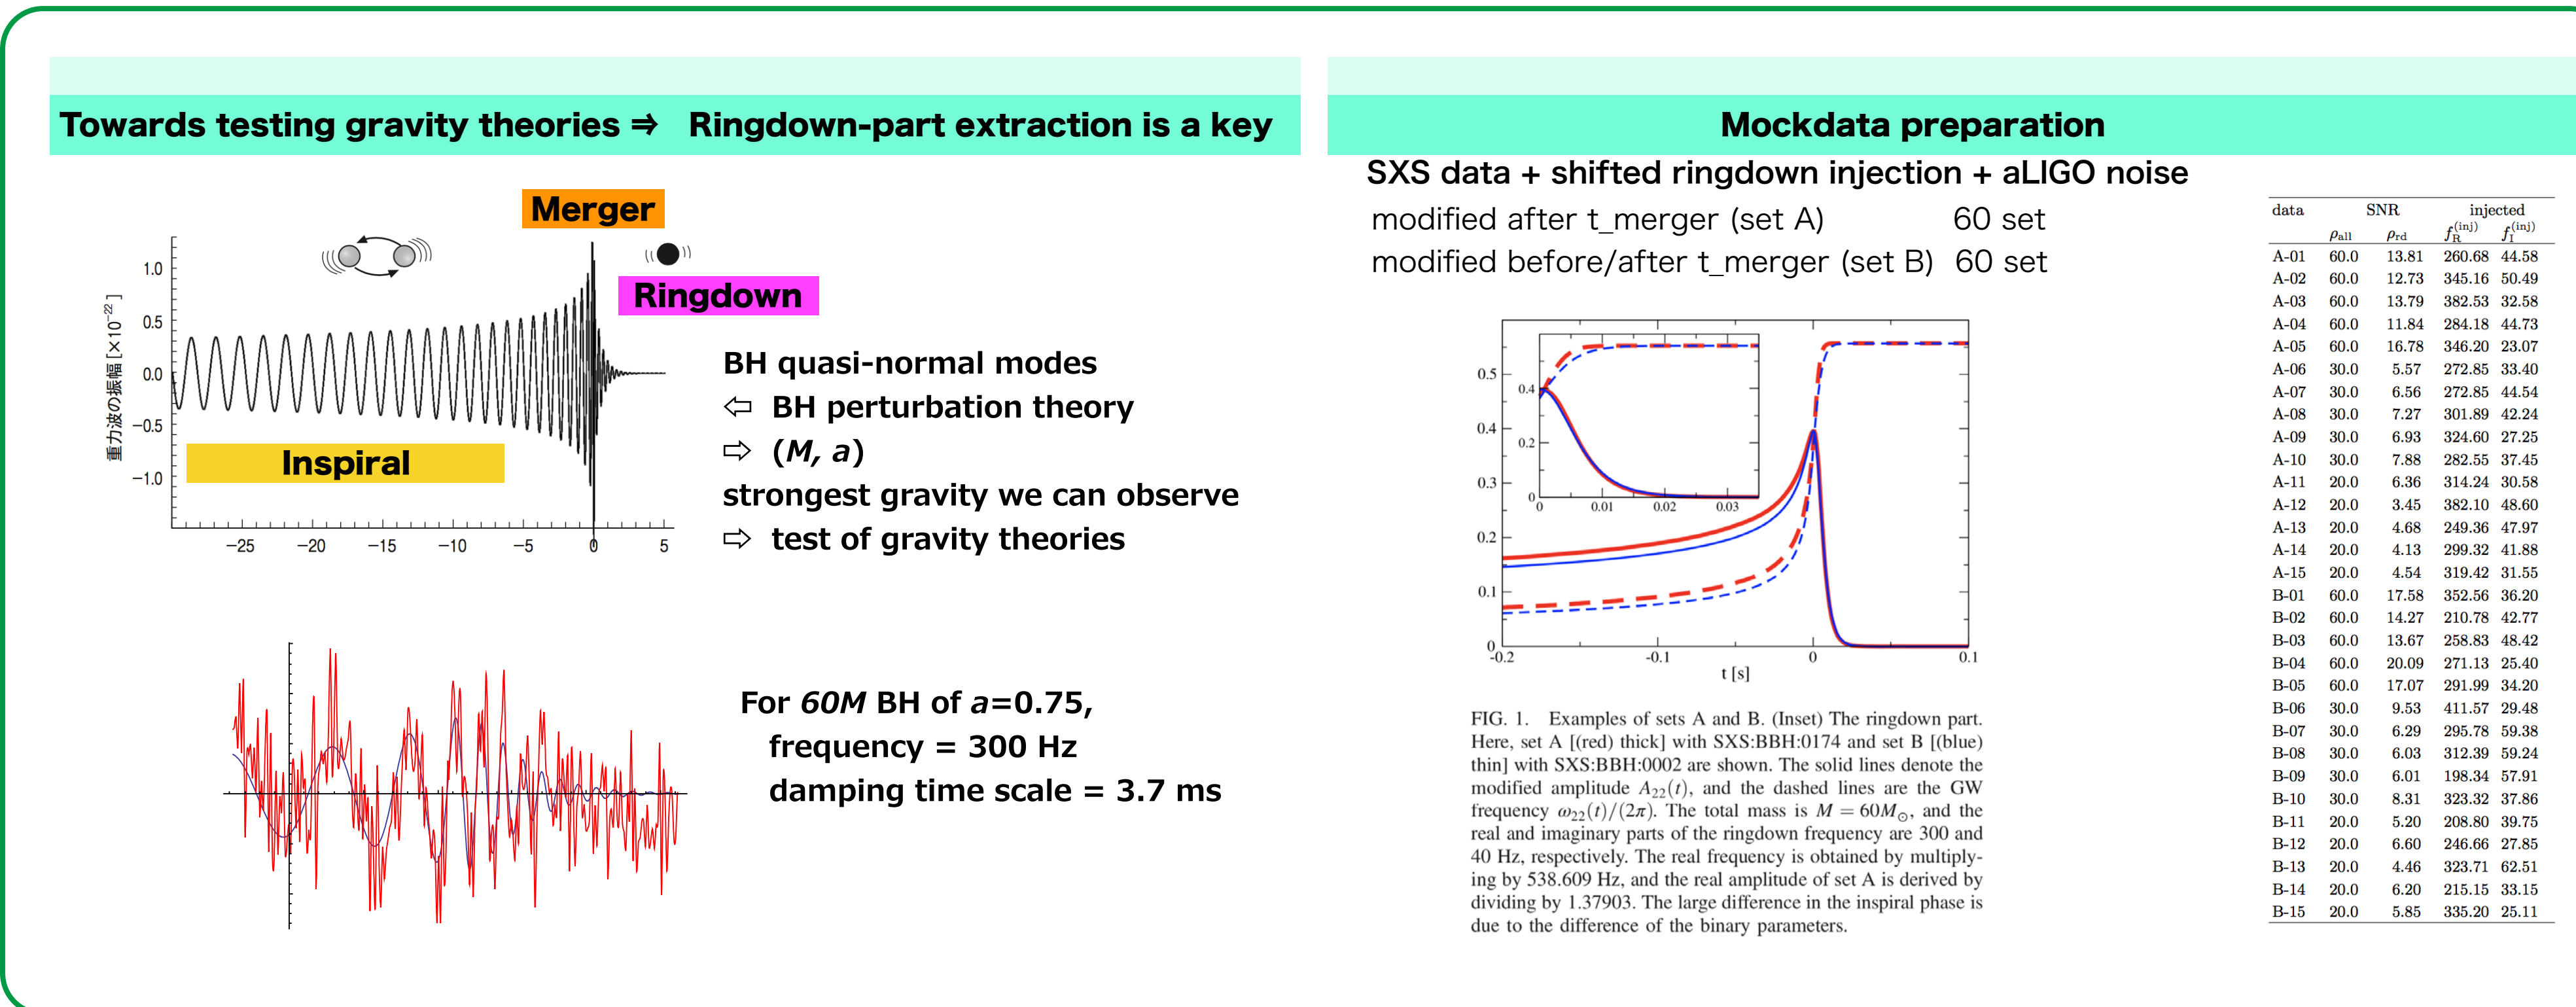

- (1a) plain matched filtering with ringdown part (MF-R) method,
- (1b) matched filtering both merger and ringdown parts (MF-MR) method,
- (2) Hilbert-Huang transformation (HHT) method,
- (3) autoregressive modeling (AR) method, and
- (4) neural network (NN) method.

## Motivation & Mockdata

## Comparison

## Methods

Application to O1-O2 events is on-going.

## ACKNOWLEDGMENTS

This research made use of data generated by the Simulating eXtreme Spacetimes. This work was supported by JSPS KAKENHI Grant No. JP17H06358 (and also JP17H06357), A01: Testing gravity theories using gravitational waves, as a part of the innovative research area, "Gravitational wave physics and astronomy: Genesis". H. N. acknowledges support from JSPS KAKENHI Grant No. JP16K05347. The work of T. N. was also supported in part by a Grant-in-Aid for JSPS Research Fellows. H. S. acknowledges also support from JSPS KAKENHI Grants No. JP18K03630 and No. 19H01901. H. T. acknowledges support from JSPS KAKENHI Grant No. JP17K05437. T. T. acknowledges support from JSPS KAKENHI Grants No. JP26287044 and No. JP15H02087.
